Learn how to access a microservice and build a reliable infrastructure using Spring Boot 2 and Spring Cloud with a proven actionable and hands-on approach

Learning new technology can be fast and fun. With this custom tailored learning plan you advance in building microservices with Spring Boot by actually building applications.

Together we build a tiny application using the microservice we created in "Spring Boot: How To Get Started and Build a Microservice" and expand the scenario with common patterns used in microservice environments for building a reliable fault tolerant infrastructure. You can follow along without having read the previous book.

You learn best by coding.

We use Spring Boot 2 with the Milestone 2.

What you will build:

We will write a simple client application for our microservice and improve it with each step to handling load balancing, failovers, service discovery and more.

What you will learn:

- How to access a remote API with Spring's RestTemplate
- How to do retries and fallbacks in case of API errors
- How to add client side load balancing to it
- How to use the circuit breaker pattern with Spring Cloud
- How to register and discover services
- What the role of a gateway is

How you can easily add a gateway

How to store configurations in a central place
